Problem: Relation Extraction

- identifying relations between named entities
- motivation:

Freebase is incomplete

- **Missing Facts:** `placeOfBirth` attribute is missing for 71% of the people (Dong et al., 2014)
- **Missing Entities:** Contains no information about `UCL Machine Reading Lab`
- **Missing Relations:** May contain `profAt(John Shawe-Taylor, UCL)` but not `givesLecturesAt(John Shawe-Taylor, UCL)`
- **Machine reading and reasoning to the rescue!**

- matrix Factorization = low-rank embedding

Approach 1: Matrix Factorization (Low-rank Embedding)

- ✓ generalization
- ✓ tractable (computation is easy)
- ✗ hard to fix mistakes
- ✗ data sparsity

Approach 2: Logical Inference (Rule-based)

- ✓ easy to modify and improve
- ✓ data sparsity
- ✓ easy to fix mistakes
- ✗ generalization
- ✗ intractable (e.g. Markov Logic Networks)

Research Questions

- How to inject logical background knowledge into embedding?
- Does injection of logic formulae into the embeddings of entity-pairs and relations provide any *benefits*?
 - 行列分解に FOL で書かれた知識を導入することでどの程度予測精度が向上するか?
 - データの疎性に対して頑健か?
 - 「ならば」の非対称性を捉えた学習になっているか?

Notation [1]

- $\langle \text{constant} \rangle ::= e_i, e_j \in \mathcal{E}$
 - named entities
 - e.g. NOLAN
- $\langle \text{predicate} \rangle ::= r_m \in \mathcal{R}$
 - binary relations between the entities
 1. textual patterns (e.g. *#2-co-founder-of-#1*)
 2. Freebase relations (e.g. company/founders)
- $\langle \text{term} \rangle ::= \langle \text{constant} \rangle | \langle \text{varriable} \rangle$
 - using function-free first-order logic
 - no function symbols

Notation [2]

- $\langle \text{ground atom} \rangle ::= r_m(e_i, e_j)$
 - predicates applied to constants
 - e.g. `directorOf(NOLAN, INTERSTELLAR)`
- $\mathcal{w} = \{r_m(e_i, e_j)\}$: possible world
 - a set of ground atoms
 - = training data

Results / Consideration

Joint: Joint Optimization

- \mathcal{F}
 - a logical formula
- \mathcal{F}
 - a training set of logical formulae
 1. ground atoms (facts)
 2. logical background knowledge

Objective Function

$$\min_{\mathbf{V}} \left(\sum_{\mathcal{F} \in \mathfrak{F}} \mathcal{L}([\mathcal{F}]) + \lambda \sum_{\mathbf{v} \in \mathbf{V}} \|\mathbf{v}\|_2^2 \right)$$

- $[\mathcal{F}] := p(\mathcal{F} | \mathbf{V})$
 - the marginal probability that the formula \mathcal{F} is true under the model
 - 論文では $p(\mathbf{w} | \mathbf{V})$ と記載
- $\mathcal{L}([\mathcal{F}]) := -\log([\mathcal{F}])$

optimize using AdaGrad \rightarrow We need to calculate

- the marginal probabilities $[\mathcal{F}]$
- the gradients of the losses $\partial \mathcal{L}([\mathcal{F}]) / \partial \mathbf{v}$

for every $\mathcal{F} \in \mathfrak{F}$

Ground Atom

- if $\mathcal{F} = r_m(e_i, e_j)$ then
- $[\mathcal{F}] = \sigma(\mathbf{v}_{r_m} \cdot \mathbf{v}_{(e_i, e_j)})$

$$\partial[\mathcal{F}]/\partial\mathbf{v}_{(e_i, e_j)} = [\mathcal{F}](1 - [\mathcal{F}])\mathbf{v}_{r_m} \quad (2)$$

$$\partial[\mathcal{F}]/\partial\mathbf{v}_{r_m} = [\mathcal{F}](1 - [\mathcal{F}])\mathbf{v}_{(e_i, e_j)} \quad (3)$$

$$\partial\mathcal{L}([\mathcal{F}])/\partial\mathbf{v}_{(e_i, e_j)} = -[\mathcal{F}]^{-1}\partial[\mathcal{F}]/\partial\mathbf{v}_{(e_i, e_j)} \quad (4)$$

$$\partial\mathcal{L}([\mathcal{F}])/\partial\mathbf{v}_{r_m} = -[\mathcal{F}]^{-1}\partial[\mathcal{F}]/\partial\mathbf{v}_{r_m}. \quad (5)$$

Logical “And” (A Set of Ground Atoms)

- $[\mathcal{A} \wedge \mathcal{B}] = [\mathcal{A}][\mathcal{B}]$
 - provided both formula concern **non-overlapping** sets of ground atoms
 - 重なりがある場合は互いに素な集合に分ければよい
 - if $\mathcal{F} = \mathcal{F}_1 \wedge \dots \wedge \mathcal{F}_n$ then
 - $[\mathcal{F}] = \prod_{\mathcal{F}_i \in \mathcal{F}} [\mathcal{F}_i]$
 - $\mathcal{L}([\mathcal{F}]) = \sum_{\mathcal{F}_i \in \mathcal{F}} \mathcal{L}([\mathcal{F}_i])$
 - 以後,
 - 論理式 = 論理式が満たすべき ground atoms の集合
 - モデル V に対する論理式の条件付確率 = 論理式をなす ground atom の条件付き確率
($\sigma(\mathbf{v}_{r_m} \cdot \mathbf{v}_{(e_i, e_j)})$) の総積
- …と考える

Complex Logical Formulae

Negation

- $[\neg \mathcal{A}] = 1 - [\mathcal{A}]$

Other Logical Connectives (\wedge, \vee を用いて)

- $[\mathcal{A} \vee \mathcal{B}] = [\neg(\mathcal{A} \wedge \mathcal{B})] = [\mathcal{A}] + [\mathcal{B}] - [\mathcal{A}][\mathcal{B}]$
- $[\mathcal{A} \implies \mathcal{B}] = [\neg \mathcal{A} \vee \mathcal{B}] = \dots = [\mathcal{A}][(\mathcal{B}) - 1] + 1$

Universal Quantifier

- if $\mathcal{F} = \forall x, y \in \mathcal{E} : \mathcal{G}(x, y)$ then
- $[F] = [\forall x, y \in \mathcal{E} : \mathcal{G}(x, y)] = [\wedge_{x,y \in \mathcal{E}} \mathcal{G}(x, y)]$

More Complex Logical Formulae

以上を再帰的に適用

“Implications”

- if $\mathcal{F} = \forall x, y \in \mathcal{E} : r_s(x, y) \implies r_t(x, y)$
- $\mathcal{F}_{ij} := r_s(e_i, e_j) \implies r_t(e_i, e_j)$
- $[\mathcal{F}] = \prod_{(e_i, e_j) \in \mathcal{P}} [F_{ij}]$
- $\mathcal{L}([\mathcal{F}]) = \sum_{(e_i, e_j) \in \mathcal{P}} \mathcal{L}([F_{ij}])$

$$[\mathcal{F}_{ij}] = [r_s(e_i, e_j)] ([r_t(e_i, e_j)] - 1) + 1 \quad (6)$$

$$\frac{\partial \mathcal{L}([\mathcal{F}_{ij}])}{\partial \mathbf{v}_{r_s}} = -[\mathcal{F}_{ij}]^{-1} ([r_t(e_i, e_j)] - 1) \frac{\partial [r_s(e_i, e_j)]}{\partial \mathbf{v}_{r_s}}$$

$$\frac{\partial \mathcal{L}([\mathcal{F}_{ij}])}{\partial \mathbf{v}_{r_t}} = -[\mathcal{F}_{ij}]^{-1} [r_s(e_i, e_j)] \frac{\partial [r_t(e_i, e_j)]}{\partial \mathbf{v}_{r_t}} \quad (7)$$

$$\frac{\partial \mathcal{L}([\mathcal{F}_{ij}])}{\partial \mathbf{v}_{e_i, e_j}} = -[\mathcal{F}_{ij}]^{-1} ([r_t(e_i, e_j)] - 1) \frac{\partial [r_s(e_i, e_j)]}{\partial \mathbf{v}_{e_i, e_j}}$$

$$- [\mathcal{F}_{ij}]^{-1} [r_s(e_i, e_j)] \frac{\partial [r_t(e_i, e_j)]}{\partial \mathbf{v}_{e_i, e_j}}. \quad (8)$$
